I. GENERAL REQUIREMENTS INFORMATION

Purpose of Document

The University of Michigan Library wishes to establish a list of preferred digitization vendors to provide supplementary services to the University’s digitization efforts.

This document will establish the parameters and requirements which will guide these digitization projects: the general terms for these digitization projects; the financial requirements; a general description of the materials; a description of the types of project shipments; the technical requirements for the digital images being produced; the evaluation process which will be applied by the University on the vendor proposals and the digital product of preferred vendors ongoing; and the delivery requirements for providing the digital product to the University.

For the purposes of this document, the term 'project' shall be defined as one or more shipments of University materials that follow the same digitization and delivery standards. Materials for each project may come from different collections and include different types of material.

Scope of Work

The types of scanning projects covered by this RFP will include but may not be limited to the following:

Michigan Digitization Project

These projects will be the most common type of shipment and materials sent to a preferred vendor. Materials in these projects will be paper-based, primarily textual materials such as books and bound volumes, pamphlets, etc. from the University’s general library collections, special collections, and archives that are unable to be scanned through the ongoing Michigan Digitization Project with Google. The reasons why these materials were unable to be scanned by Google varies, but predominantly includes: items in poor condition; oversized items; disbound items; items with large foldouts; items with binding issues; etc. Vendors are expected to have the capacity to scan all of these materials without causing unreasonable wear and tear to the items. If a vendor is unable to digitize one or more of these categories listed above, they must list these exclusions in their response to the RFP.

Projects in this category will be clearly indicated by a packing note in each box that designates the project as a Michigan Digitization Project (MDP) shipment. This designation will affect the file structure and types of page image files required, as detailed later in this document.

Individual volumes in projects in this category will be identified in their digitized data format by the volume barcode located on the inside back cover of each volume. If a vendor finds any volume in projects of this category which does not have an identifiable barcode, the vendor must contact the Digital Conversion Unit (DCU) immediately for instructions.

MDP projects will be shipped to the vendor with a minimum of preparation work. The shipping containers will include a packing list only. Vendors are permitted to make their own judgments with regards to the proper color space for individual pages. Criteria for making these judgments are detailed in Section IV under Image Capture Requirements.
Note: The following changes have been made from previous years:
- Volumes in MDP shipments will no longer include a production note target.
- The AIIM scanning target is no longer required and should be omitted from all future deliveries.
- The “notes.txt” file has been replaced by the “vendor scanning notes” file, as detailed in Appendix E.

Bibliographic Identifier Project

These projects will be the second most common type of materials shipped to a preferred vendor. Materials in these projects will be paper-based, primarily textual materials such as books and bound volumes, pamphlets, manuscripts, archival materials, and so on. These materials may be drawn from the University’s general library collections, special collections, archives or museums. Any special handling instructions and requirements will be included with the project documentation and may be discussed with vendor before shipment of the project. Projects in this category will be clearly indicated by a packing note in each box that designates the project as a Bibliographic Identifier (BibID) shipment. This designation will affect the file structure and types of page images required, as detailed later in this document. Individual volumes or parts of volumes in this category will be identified; if a vendor finds any volume in BibID projects lacking identification, the vendor must contact MPublishing immediately for instructions.

BibID projects will be shipped to the vendor after preparation work is performed by MPublishing. The shipping containers will include a packing list, and minimally each volume shall also have a production note target. The preparation work shall identify specific pages requiring color or grayscale imaging.

Note: The following changes have been made from previous years:
- Volumes in these shipments will no longer have a production note target.
- The AIIM scanning target is no longer required and should be omitted from all future deliveries.
- The “notes.txt” file has been replaced by the “vendor scanning notes” file, as detailed in Appendix E.

Miscellaneous projects

The University may ask preferred vendors to scan for smaller miscellaneous projects as well. Most materials in these projects will be paper-based, primarily textual materials such as books and bound volumes, pamphlets, manuscripts, archival materials, and so on. On occasion the University needs to have microfilm, fiche, or photographic materials digitized. These materials may be drawn from the University’s general library collections, special collections or other departments and units on campus. Any special handling instructions and requirements will be included with the project documentation and will be discussed with vendor before shipment of the project.

Miscellaneous projects may be prepared and shipped to the vendor by a unit other than DCU or MPublishing. Each project will use either MDP or BibID specifications with slight modifications (provided by the unit ahead of time) to suit the needs of each project. Vendors should return the
physical material, digitized data, and invoices for the work to the unit which prepared the shipment, whether that is DCU, MPublishing or another unit.

II. REQUIRED DELIVERABLES FOR PROPOSALS

The following deliverables are expected from all vendors who provide a proposal in response to this RFP. These documents and files will provide the basis for evaluating the vendor’s proposal. See Appendix A for the checklists that the University will use for evaluation.

Written Proposal Document

Vendors who respond to this RFP must provide a written proposal which details that vendor’s ability to meet each of the requirements of this document. The structure of the proposal document is left to the discretion of the vendor, but it must address every requirement detailed in this document.

In addition, vendors submitting proposals should address their ability to meet the general specifications outlined in this RFP, including:

- Overall technical approach; proposed methodology; demonstrated understanding of the scope of work and the requirements.
- Vendor facilities and equipment, including detailed descriptions of the variety of equipment available in their facility (scanning equipment, digital cameras, lighting, book cradles, etc.)
- Post-processing and quality control procedures, including software used for each process
- Previously demonstrated production experience and past performance, including a minimum of three references from other institutions for which the vendor has performed comparable work.
- Capability and experience of key personnel.
- Project management and corporate support capability.

Sample Digital Image Files

Vendors who submit proposals in response to this RFP must submit sample digital image files along with their written proposal document. These sample digital image files must minimally include one TIFF formatted image file and one JPEG2000 formatted file; more are appreciated. Both files must be formatted according to the technical requirements detailed in this document, including all metadata fields, though in the sample image files, these metadata fields may be populated with “dummy” or placeholder information.

If the sample images fail to pass evaluation with the University, the University will provide a list of errors it is able to find to the proposing vendor and provide that vendor an opportunity to fix or repair those sample images for resubmission with the original proposal. Resubmitted sample images which do not meet the requirements and specifications of this document may be considered grounds for rejecting that vendor’s proposal.

The original submission of sample image files must be received along with the proposal document.
Pricing Matrix for Scanning

The vendor must also produce a pricing matrix for digitization costs. This matrix must be complete enough to allow the University to accurately and fairly estimate the costs of any individual project for budgetary or recharge purposes. The University strongly prefers a cost-per-image model of cost matrix, but the vendor may provide another metric if that more accurately details the costs of a project. All cost line items which may appear on a project invoice must be detailed in this pricing matrix, even if the costs cannot be accurately estimated (e.g. shipping costs are highly variable but should be mentioned and addressed in the document). This pricing matrix must be formulated and submitted to the University along with the proposal document and sample image files.

III. GENERAL REQUIREMENTS FOR PREFERRED VENDORS

Subcontracting

All digitization will be done on the vendor’s premises. No subcontracting of this work will be permitted without the prior written approval of the library.

Vendors with digitization facilities located outside North America must provide detailed information about these facilities in their proposal, even if those facilities are part of the vendors’ overall business operations. Any costs not included in the vendor’s pricing matrix which will be incurred by the University must also be detailed (e.g. shipping and insurance costs to international facilities).

Failure to disclose subcontracting, a vendor’s intent to use facilities outside North America, and/or failure to include any associated costs may result in rejection of that vendor’s proposal or immediate revocation of Preferred Vendor status.

Rights

The materials to be scanned, the image files, and the contents of the images remain the property of the University of Michigan University Libraries. These may not be reproduced, sold, or distributed without the express written authorization of the University.

Responsibilities

The Digital Conversion Unit staff of the University Libraries are responsible for the projects governed by this agreement and will track the flow of materials through the digitization process from the point of shipment to the vendor and on through to payment for services.

For MDP materials, the Digital Conversion Production Manager serves as the primary contact and business manager. The DCU staff will carry out the pre-scanning preparation of the selected material and post-scanning processing of the digital product.

For BibID materials, the Digital Publishing Project Manager serves as the primary contact and business manager. MPublishing staff will carry out the pre-scanning preparation of the selected material and post-scanning processing of the digital product.
For Miscellaneous materials, the primary contact and staff performing shipping, review and business manager will be identified when each project is set up.

**Digitization Capabilities**

Each vendor must supply a detailed description of their own digitization capabilities to the University. This detail should include, but is not limited to, the maximum physical dimensions of individual scan image at the acceptable resolutions, make and models of scanners, color depth capabilities of scanning equipment, number of scanning stations, and so on.

**Handling**

Vendor personnel shall perform all handling and scanning labor which includes: handling original materials with care when unpacking; performing the scanning and associated record keeping; delivering digital images and associated records to the Library; returning all volumes associated with a single shipment at the same time, once the Library accepts the digital images, unless otherwise agreed upon by DCU.

Some materials, both bound and unbound, may be designated by the Library as fragile and requiring special handling. The Library will provide instructions for special handling and scanning techniques for such materials as needed.

While most materials will be sturdy enough to be scanned without damage, it is not always possible to anticipate potential damage to the original source material during the scanning process. In the event that any damage to an original occurs during the initial capture – whether with bound or loose items - the scanning technician shall cease scanning immediately and request instructions from the Digital Conversion Production Manager before continuing any further with that original. At a minimal level, damage is defined as: the breaking of the book spine; pages coming out of the original binding; and/or the cracking of brittle pages to the point of losing text.

If the amount or frequency of damage to Library materials is more than the Library deems appropriate, the University will require the vendor to revise their handling and scanning procedures. If the vendor cannot resolve the matter to the University’s satisfaction, the project will be reassigned to another vendor. Excessive damage to rare materials and special collections materials will be assessed at the vendor’s expense. See Appendix B for details.

**Costs**

Each vendor must supply a pricing matrix to the University that provides enough detail so as to allow the University to accurately estimate project costs within 5% of invoice total. This matrix may be structured according to vendor preferences but must include and detail per image costs according to any document size thresholds, any per image cost differences among bitonal, grayscale, and color capture, and any per image costs for image post-processing.

Vendors must also provide a detailed list of ancillary costs that projects will incur which are unpredictable, such as: shipping costs for return of materials; shipping costs for data delivery; media costs for burned optical discs or supplying external hard drives; etc.
The University may have rush projects; vendors are strongly encouraged to provide any additional cost information for rush services, if such service is available. The University will need to know details about any targeted or guaranteed turnaround times, additional costs, and methods for designating a shipment as a rush shipment.

**Communication**

Digitization vendors are encouraged to bring up questions, concerns, technical difficulties, etc. on an ongoing basis through the course of providing digitization services to the University. In order to facilitate efficient exchange of information, the University prefers for each vendor to designate a contact person for communication with the University regarding these digitization projects.

**Progress Reports**

The University of Michigan requires periodic progress reports on the status of projects, either on a biweekly or monthly basis. These progress reports must include the University shipment number, the date of shipment receipt by the vendor, and an estimated percentage complete. A projected date for completion is highly encouraged. The University prefers to receive such reports via email.

**Invoicing**

The vendor shall provide a detailed invoice for the digitization charges within ten (10) business days of shipping the digital product to the University. Each vendor’s invoice must reference the following:

- University of Michigan Purchase Order Number
- Shipment number (or other identifier)
- Total number of images, itemized according to type (e.g. bitonal, grayscale, and color itemized separately)
- Cost per image rate
- Volume names and item contents for media delivered (regardless of delivery option)
- Any other itemized charges (cost per media, shipping costs, transportation, etc.)
- Total charge for the shipment

All MDP invoices shall be sent to Larry Wentzel, Digital Conversion Production Manager. Electronic submission of invoices to lwentzel@umich.edu is strongly preferred; however, if paper invoices are the only possibility for a vendor, they must be mailed to the following address within the same required timeframe:

Larry Wentzel  
University of Michigan  
Digital Conversion Unit  
837 Greene Street Rm 3208A Buhr  
Ann Arbor, MI 48104-3213  
USA
All BibID invoices shall be sent to Jason Colman, Digital Publishing Project Manager. Electronic submission of invoices to taftman@umich.edu is strongly preferred; however, if paper invoices are the only possibility for a vendor, they must be mailed to the following address within the same required timeframe:

Jason Colman  
University of Michigan  
MPublishing  
837 Greene Street Rm 1100 Buhr  
Ann Arbor, MI 48104-3213  
USA

Miscellaneous project invoices will handled by the project manager identified with each project. Contact information will be provided at that time.

Due to the nature of the University financial system, vendors will receive payment of each invoice within two months/60 days of the Senior Finance Specialist receiving the vendor’s invoice. The University will not approve service charges for unpaid account balances of less than 60 days.

IV. TECHNICAL REQUIREMENTS FOR DIGITIZATION PRODUCT

The following criteria represent the digital imaging requirements for the vendor digitization product of projects governed by this document.

File Directory Structure Requirements

The file directory structure requirements for the digitization product depends significantly on what designation has been given to an individual project. The differences are detailed in the following sections:

Michigan Digitization Projects (MDP)

Projects of this category and designation require a very flat file structure. The top level of directories consists of directories named for the 7-digit shipment number provided with the materials. The second level directories will each be named after the 14-digit barcode of individual physical volumes. Each physical volume gets its own directory named for the volume barcode. All page images from outside front cover to outside back cover should be stored inside the barcode folder. The page image files must be named with an eight character file name followed by a three letter file extension. The files start at 00000001.tif and continue sequentially from the outside front cover to the outside back cover.

This directory structure and its requirements are further detailed in Appendix C.

Bibliographic Identifier Projects (BibID)

Projects of this category and designation require a hierarchical file directory structure. The top level of directories consists of directories named for the bibliographic identifier for individual
titles. Under these BibID directories will appear one or more subdirectories, named by four digit numbers, for the volume number or year of a multivolume set if applicable. Under these volume directories will appear one or more subdirectories, named by three digit numbers, for the issue number or part of a multivolume set if applicable. The production note target will detail each of these levels in the hierarchy, making the naming and organization of each of these levels of the file structure hierarchy clear. Each shipment will have its own directory hierarchy, with a second level directory for each item named using the bibliographic identifier, a third level volume directory, and one or more fourth level issue/part directories. Every page, from outside front cover to outside back cover, should have a corresponding bitonal image file contained within the fourth level subdirectory (named with the three digit number); multivolume or multipart bibliographic volumes may be contained within subdirectories under the same third level directory.

Any continuous tone image files (grayscale and color) must be stored in an additional fifth level subdirectory named “pages” (lowercase only). The contone image files in this “pages” directory must be named with an eight character file name which is identical to its corresponding bitonal image in the directory above. The initial zero of the bitonal filename should also be changed to a lower case letter “p” for the contone image file name. For example, if the 212th page image in a single volume work has a color photograph, there will be two image files for it: a bitonal image named “00000256.tif” in the directory “<bibid>/0001/001/” and a color contone image named “p0000256.jp2” in the directory “<bibid>/0001/001/pages/” as well.

This directory structure and its requirements are further detailed in **Appendix D**.

**Image Capture Requirements**

The following image capture requirements apply to all projects, regardless of their designation as either an MDP project or a BibID project.

The normal image capture requirement for all volumes is to capture them from outside front cover to outside back cover, with all images kept and named in sequential order. File names should start at 00000001 and increment sequentially for each additional image, following the sequence of the original library materials. Page image files must also be named with a file extension appropriate to the image file format, as detailed later in this document. The front cover image should include the spine if possible. All end papers and covers shall be scanned as well unless otherwise instructed by the University.

**Michigan Digitization Projects (MDP)**

For projects designated as MDP projects, vendors are required to produce one and only one image for every page within a physical volume. Each image shall be in the required format for the image’s content type (bitonal or contone) as detailed later in this document. Pages containing only black and white text or simple line drawings must be captured as bitonal images. Pages containing half-tone or continuous tone photographs and highly detailed lithographs should be captured as grayscale images. Pages containing any meaningful color elements should be captured as color images. It is permissible for vendors to capture every page in color and then derive the appropriate image file from that.
Bibliographic Identifier Projects (BibID)

For projects designated as BibID projects, vendors are required to produce one bitonal image for every page within a physical volume. In addition, vendors are required to produce contone images for those pages whose content dictates continuous tone imaging. It is permissible for vendors to capture every page in the color space appropriate for that page and to derive an additional bitonal image file for those pages that require both color and bitonal imaging. Pages containing only black and white text or simple line drawings must be captured as bitonal images. Pages containing half-tone or continuous tone photographs and highly detailed lithographs should be captured as grayscale images. Pages containing any meaningful color elements should be captured as color images.

The following categories represent special categories which may be encountered in any volume in any project, regardless of designation. Any vendor encountering a special situation which is not addressed in this document should be contact the University for further instruction.

Missing Pages

In all projects, physical volumes may have missing pages. For any bibliographic entity where the pagination is broken by missing pages, missing page targets must be inserted. For MDP projects, the amount of materials and the minimal preparation of each volume prevent DCU staff from flagging each instance where a page is missing; for BibID and other projects, MPublishing staff may flag these missing pages. Should vendor scanning technicians find other pages missing they must insert missing page targets as appropriate.

For example, if pages 5 and 6, 21 and 22 are missing from the original text, the scanning operator must replace the missing pages with missing page targets for both the front and the back of each leaf (this example would require 4 missing page targets). Should the scanning operator notice a missing page without a flag, he/she should insert the missing page target. The sequence should follow the original source document sequence and the corresponding files as if the missing page were scanned.

The missing page targets should be 8.5” x 11” targets regardless of the size of the physical volume. The text of the missing page target must be “Page Missing in Original Volume” in minimally 36 point font.

Please see Appendix E for examples of how missing pages should be documented in the vendor scanning notes file.

Foldouts, Centerfold Images, or Two-Page Spreads

These types of pages present special challenges in capture. The University requires that all foldouts are to be scanned as a single image file without adjusting the resolution (e.g., we will not accept images captured at a lower resolution in order show the entire image in one shot). Normally a foldout 11” x 17” can be scanned on most scanners without adjustment to resolution. If a foldout is bigger than the maximum dimensions of the vendor’s digitization equipment, we ask that the images be captured in multiple images and stitched together, if possible.
If the vendor has the capability to stitch images, the University asks the vendor to take multiple, overlapping scans of the foldout (horizontally and vertically, if necessary) and stitch them together into a single file. The final file should comply with file name, image quality, and file format requirements mentioned later in this document. The University asks vendors to provide cost proposals for all services involved in stitching (setup, cost per shot, stitching cost, etc.).

If the vendor is unable to stitch multiple scans together, the vendor should notify the University. The foldout should be scanned as-is (folded up) and named according to the file sequence. A note should be placed in the Vendor Scanning Notes.xlsx spreadsheet for each foldout that could not be captured in that volume, noting the filename and foldout title (Appendix E).

If the vendor is able to capture a foldout, but is hindered by condition, binding, or other physical concerns, the University may allow the foldout(s) to be removed for better image capture; the vendor should contact the University for instructions. Foldouts may be removed only with prior permission from the University. If foldouts are removed, they should be placed in their proper order within the volume from which they came. Vendors should not attempt to reattach the foldouts to the book themselves.

Centerfolds (including two-page spreads and uncut plates) will be treated as foldouts in the scanning process. Unless otherwise requested, an extra blank page (8.5” x 11”) should be inserted after the centerfold image to maintain the correct recto/verso sequence. See Appendix F for sample diagram.

**Image Color Requirements**

The following image color requirements apply to all page images in all projects, regardless of their designation as either an MDP project or a BibID project.

**Bitonal Images**

Any page image which consists of text only or which consists of line art against the background paper color should be captured as a bitonal image. Black-and-white halftone images (e.g., photographs reproduced in a newspaper) should also be captured as bitonal images. Vendors are encouraged to use their best judgment for legibility. For example, if capturing a chart on lined graph paper as bitonal creates a lot of background noise, the vendor can capture the page in grayscale instead.

**Grayscale Images**

Any page image which uses halftone or continuous tone photographs, variously shaded gray graphs or diagrams, or variously shaded gray lines to distinguish among multiple chart or illustrative elements should be captured as a grayscale image. All grayscale images should be captured in an 8-bit color space, preferably in the sRGB color space.

In all projects, vendors are expected to use reasonable judgment to determine whether a grayscale image is the most appropriate image capture method; in the case where it is not definitely clear whether to capture in grayscale or color, the vendor can safely assume to use color. Vendors who are unsure about whether to capture any given page image in grayscale are welcome to contact the University for additional instructions.
**Color Images**

Any page image which uses faded handwriting, color photographs, colored bar graphs or diagrams, or colored lines to distinguish among multiple chart or illustrative elements should be captured as a color image. All color images should be captured in a 24-bit color space, preferably the sRGB color space.

In all projects, vendors are expected to use reasonable judgment to determine whether a color image is the most appropriate image capture method; in the case where it is not definitely clear, the vendor can safely assume to use color. Vendors who are unsure about whether to capture any given page image in color are welcome to contact the University for additional instructions.

**Image Resolution Requirements**

The following image resolution requirements apply to all projects governed by these specifications, regardless of the individual project’s designation as an MDP project or a BibID project. Vendors should report their ability to meet these requirements in detail as part of their proposal document.

On all images in all color spaces, X resolution and Y resolution (pixels per inch along the X-axis and Y-axis) must be identical values.

**Bitonal Images**

All bitonal page images must have a resolution measured in pixels per inch (ppi) of 600 ppi. This resolution should be an uninterpolated optical resolution wherever possible; if the scanning equipment can only achieve this resolution via interpolation, the resolution must be interpolated by the scanning camera and its software as part of the original page scan, not as part of a separate post-processing image adjustment.

If the optical resolution of the scanning equipment is not able to achieve an exact optical resolution of 600 ppi – which may occur when scanning foldouts or oversized material -- the vendor should contact the University for instructions. It is an acceptable practice to scan at 400 ppi 8-bit grayscale or 24-bit color optically and convert to 600 ppi bitonal. All other deviations from the normal 600 ppi resolution for bitonal images must be approved in advance and then recorded in the vendor scanning notes file for that volume or bibliographic entity.

**Continuous Tone (Color & Grayscale) Images**

All contone (continuous tone) page images must have a resolution measured in pixels per inch (ppi) of 400 ppi. If the optical resolution of the scanning equipment is not able to achieve an exact optical resolution of 400 ppi – which may occur when scanning foldouts or oversized material --, the vendor should contact the University for instruction. It is acceptable to scan a contone image at a higher resolution (e.g., 600 ppi) and then downsample the final image file to 400 ppi, preferably using bicubic interpolation in post processing.

In the event a vendor cannot scan an oversized item or foldout at 400 ppi (optical or downsampled), the vendor shall contact the University immediately for instructions on how to proceed. Upsampling of color or grayscale images is not allowed. Any approved deviation from acquiring an image at 400ppi optical resolution for contone images (e.g., deriving 400 ppi from a
higher resolution) must be recorded in the vendor scanning notes file for that volume or bibliographic entity.

**Image Quality Requirements**

When digitizing from microfilm or microfiche, all page images should be rotated (where appropriate) so that the page image appears in proper reading position on screen when the image file is opened.

All page images, whether digitized from a book or from microfilm, should fill the image frame to the largest extent possible. When scanning from microfilm, preservation microfilming guidelines require that the reduction ratio on a single reel of microfilm remain constant throughout the reel. In the case where bibliographic entities are smaller than the page and do not fill the individual frame on the reel, the vendor does not need to take any corrective action. Vendors should eliminate or minimize the amount of black border that frames the page image either during capture or in post-processing the image.

When scanning from a 2N microfilm print master negative, all images must have their polarity reversed, so that text and graphics appear as black/gray pixels against a white background. All 2-up frame images must be split at the gutter (where appropriate) to produce separate images files for each page (recto and verso). Foldouts or other single pages which fill the full microfilm frame must not be split.

**Image Format Requirements**

All images files shall be provided in either one of two formats: TIFF or JPEG2000.

**TIFF Format Image Requirements**

For all TIFF format image files, the internal bitmap must be single strip format. Color TIFF images must all be in the sRGB color space.

Compliance with the TIFF format specification will be verified using the JHOVE object validation software, and all TIFF images must be minimally “well-formed” against the TIFF standard in order to meet acceptability criteria.

For both MDP and BibID projects, all bitonal image files delivered must be in the TIFF format and also must be in CCITT Group 4 compression. Continuous tone images for MDP projects must be delivered in JPEG2000 format, detailed later in this document.

**JPEG2000 Format Image Requirements**

Vendors are required to explain and detail their ability to support this file format in their proposal documents.

The JPEG2000 format for image files is the required format for delivery of the continuous tone (color and grayscale) digitized images produced by projects designated as MDP.
BibID projects may deliver in JPEG2000 format as an option at present, though still in the same file directory structure. This delivery format will be preferred in the near future by all University digitization projects.

In order to maintain consistency among the JPEG2000 files in the library repositories that are produced from various projects and vendors, the University requires the following parameters for all JPEG2000 files:

- The JPEG2000 file will be prepared after any image processing or clean-up is performed.
- The JPEG2000 file's image X origin, image Y origin, tile X origin, and tile Y origin will be 0.
- The JPEG2000 file will contain only one component.
- The JPEG2000 file's height and width will be the same as the master image file after transcoding.
- The JPEG2000 file will be in the sRGB color space.
- The JPEG2000's progression order will be RLCP (resolution, layer, component, position) or RLPC.
- The JPEG2000 file will have between 5 or more decomposition levels, depending on the pixel dimensions of the image. See Appendix G for details.
- The JPEG2000 file will have 8 quality layers.
- The JPEG2000 transcoding process will use the 9-7 irreversible filter.
- The default slope rate distortion used in transcoding will be 51492.
- No tiling is necessary in the JPEG2000 file.

All image files supplied in the JPEG2000 file format must be compliant with Part 1 of the JPEG2000 core coding system and meet the JP2 basic file format definition. Files must be supplied with the “.jp2” extension.

Many scanning hardware and software packages do not support native image capture to the JPEG2000 format. Transcoding an image file to the JPEG2000 file format is considered acceptable and normative. The file format of the original image file should be a non-distorting format, such as uncompressed TIFF, and not a format that inherently downgrades the quality of the image through lossy compression (JPEG).

The University of Michigan has adopted the Kakadu open source software package for the transcoding of image files into the JPEG2000 format. Due to variations among the various JPEG2000 software packages available, the University recommends Kakadu to our vendors as well, as it is an excellent and flexible package for transcoding files to the JPEG2000 format. The University has provided the parameters we use to insure compatible encoding of JPEG2000 image files in Appendix H.

**Image Metadata Requirements**

All image files must have technical and source metadata embedded within the image file itself. The requirements for metadata inclusion for each format are detailed in the following sections.
TIFF Image Metadata Requirements

To help ensure the long-term sustainability of their master images, the University of Michigan Library requires the use of some of the data elements in Draft NISO Z39.87 –2002 Standard, Data Dictionary—Technical Metadata for Digital Still Images to record technical metadata in the TIFF header of each image. In addition to required TIFF tags, some additional tags are utilized to document the provenance of each image.

In addition to the required fields for baseline TIFF images, the following fields of the TIFF header must have the appropriate values inserted:

269 DocumentName <Barcode>/<image file name> or <BibID>/<image file name>

The formats above must be consistent among the files in a single project; the <Barcode> is appropriate for projects designated as MDP projects and the <BibID> format is appropriate for projects designated as BibID projects.

306 DateTime Time and date of image capture in YYYY:MM:DD HH:MM:SS
315 Artist Scanning vendor company name

This information is mandatory and will be included in the Library’s quality assurance and evaluation processes.

In addition to the required information, the following fields in the TIFF header are recommended for recording additional technical metadata. Presence of this information is not a requirement for satisfactory performance of these specifications.

271 Make Scanner manufacturer
272 Model Include model number
305 Software Include version number

See Appendix I for a more complete explanation with sample values.

JPEG2000 Image Metadata Requirements

JPEG2000 file format specification.
See Appendix H for a more complete explanation with sample values.

File Checksum Requirements

Each bibliographic entity subdirectory shall contain a MD5 checksum signature file for all of the image files in that subdirectory. This requirement remains in effect even between the different project designations of MDP projects and BibID projects. MD5 checksums allow the University to verify that the digital image files are complete and remain intact as the files are migrated across file systems and storage media. They provide a check against bit-deterioration and serve to guarantee digital object authenticity. The checksum algorithm used should be the 128-bit md5 (Message Digest 5) algorithm described in RFC 1321 (http://www.faqs.org/rfcs/rfc1321.html).
This MD5 checksum signature file is required in all directories in which image files are contained (regardless of image file format) and only in such directories. Directories that only contain subdirectories should not contain checksum files, even though those subdirectories may contain image files themselves. The MD5 signatures for each image file are concatenated into a single file that must be named “checksum.md5” and this file must be stored in the item directory at the same level as the page image files.

The MD5 file contains one line for each image in the volume. Each line consists of the 32-character MD5 signature followed by 2 “blank” characters followed by the image file base name.

Here is a sample MD5 file:

```
786fd62b33b65560d9993d0f5f4235d1  00000001.tif
0fa7abf97a4414aed10b316c59b07249  00000002.tif
f30cc4a3d27f54329b3d9aa5b2d7bda  00000003.tif
6a621fe60557895cc66cc27b7ca77b5  00000004.tif
97c664aa9fb998dde78ce2aecbf59d73  00000005.tif
01e4b01a9de2aa1660da00998f5f13  00000006.tif
18cb443ca9d72be25fa545c2a82a541  00000007.tif
745d4e8edfc7492e43eb6053b96cfff2  00000008.tif
f238e2dd7297970cb8b5bc99258a409  00000009.tif
a22322fe76543a0df26e08de58d0bfa  00000010.tif
42e9295e8dc45cb082e2759bf3cb4b5c  00000011.tif
```

Please notice in the sample lines above that no directory names are present, nor is the directory name present in the MD5 filename; no file paths should present in the actual MD5 files.

It is considered best practice to generate MD5s in the same location as the original scanned images were saved, before moving the files to another mass storage device or disk subsystem. Vendors are strongly encouraged to verify the MD5 signatures after moving the data to another mass storage device or disk subsystem in order to verify that the content was transferred fully to the media.

**Ancillary Files**

In previous RFPs, the University required vendors to provide image files of the AIIM Scanner Test Target and the Production Note Target in each barcode folder. These image files are no longer needed and should no longer be included in all future shipments.

**Vendor Scanning Notes File**

The University requires documentation for every set of scanned page images, whether a complete physical volume or a subdivision of a physical volume. The documentation should report any problems scanning, any approved deviations from normal resolution, or any other information about the scanning process which the vendor judges should be reported to the University. The documentation should be written in a spreadsheet named “vendor scanning notes” exactly with appropriate letter case observed. An example of this file is represented in **Appendix E**.
This documentation can be provided in one of two ways: either sent via email to the Digital Conversion Production Manager (or representative of the unit responsible for the shipment), or included in each shipment folder. The University prefers to receive this documentation via email. If this is not done to the University’s satisfaction, the University may mandate an alternative means for delivering this information.

V. EVALUATION PROCESS

Vendor Quality Control Expectations

The University requires a detailed explanation of the vendor quality control processes, especially as it pertains to verifying the requirements and specification of this document.

University Quality Control of Vendor Digital Product

The University shall engage in a formal evaluation both to verify that the digital product of the participating vendors meets the specifications detailed in this document and to evaluate the quality and acceptability of the digital imaging for University digitization efforts.

The University reserves the right to:
- reject any digital file or files which fail to meet the specifications and requirements detailed in this document, as determined by the evaluation method which follows;
- require the vendor to rescan any page images which do not meet the specifications and requirements of this document or to refuse payment, up to and including the whole digital product produced for a shipment of materials;
- require the immediate return of materials, if the digital product of any vendor fails to meet these specifications and requirements after rescan.

Digital Quality Control of Files

The University shall use a variety of means to evaluate the digital product of the vendors, both through digital and manual inspection. The evaluation will include, but shall not be limited to, the following areas:

Validation of File Structure

The University will verify that the digital file structure meets the specifications in this document. This will include verifying the parent directory is named with the proper identifier according to project designation (MDP vs. BibID) and verifying that all individual bibliographic entities are broken out into appropriate subdirectories that are named according to the specifications of this document.

Validation of File Naming Conventions

The University will verify that the digital file names meet the specifications in this document. This will include verifying the number of characters in each file name as well as verifying that all files in a given subdirectory are named in sequential numeric order, according to the specifications of this document.
Validation of File Metadata
The University will verify that the required metadata elements are present in each digital file according to the specifications in this document.

Validation of Checksum
The University will verify that the required MD5 checksum files are present in each digital file subdirectory and that all digital files are fully valid and verified to a check of the MD5 calculations, according to the specifications in this document.

Validation of File Format
The University will verify that the digital image files are compliant with the image format specification that they purport to be. The primary software tool for accomplishing this will be the JHOVE object validation environment developed by Harvard University. This tool is freely available to the public at the following URL: http://hul.harvard.edu/jhove/. The University currently uses JHOVE 1.11; vendors are strongly discouraged from using version 2.x. Any questions on what constitutes an acceptable file validation output from JHOVE can be directed to the Digital Conversion Production Manager.

Qualitative Evaluation
The University shall use a variety of means to qualitatively evaluate the digital product of the vendors. The evaluation will include, but shall not be limited to, the following areas:

Evaluation of Image Clarity
All digital images must be clearly legible, in proper focus, and provide sharp representation of the original. Individual letters should be clearly identifiable. Letters with closed loops or other bounded areas should not be filled in from underexposure, and thin parts of the letters should not appear faded or broken from overexposure.

All bitonal page images should be filtered or processed so as to eliminate or reduce general noise or speckle effects that appear in the digital image. Attention should be paid to insure that removal of noise or speckling does not affect the quality of individual characters adversely.

Vendors should pay special attention to pages with illustrations, halftones, etchings, or other graphic materials and eliminate moiré patterns and false coloration which may appear in the scanned image.

In all shipments, any frames or images that are judged by the vendor to be impossible to image clearly should be reported to DCU/MPublishing and noted in the “vendor scanning notes” file to insure that University evaluation of the vendor’s digital product takes this into account.
Evaluation of Image Skew

All digital images must be deskewed to provide an easily read page image when presented on a display screen. Please be mindful of the page edges and the page content when deskewing, to prevent content from being cropped away inadvertently.

The University evaluates skew by using a level horizontal rule across the image frame compared against baseline of text on the page image. It is assumed that the baseline will be level and square on the page edge; when this is not true, the vendor should deskew to the text rather than the page edge. Deviations greater than 1 degree from the level rule are unacceptable.

Evaluation of Image Crop & Framing

All digital images should fill the frame of the image to the largest extent possible. Text pages should be cropped to just within the page border, post-deskewing. All “black borders” where the image captures beyond the page itself should be eliminated from the final digital product.

If any page has an illustration or marginalia that goes out to the page edge(s), the vendor should consult with the University for instructions before performing any image cropping.

VI. DATA DELIVERY REQUIREMENTS

Shipping Requirements & Shipping Address

All MDP products should be shipped to the following address:

    Digital Conversion Unit
    University of Michigan
    837 Greene Street Rm 3212 Buhr
    Ann Arbor, MI 48104-3213
    USA

All BibID products should be shipped to the following address:

    MPublishing
    University of Michigan
    837 Greene Street Rm 1100 Buhr
    Ann Arbor, MI 48104-3213
    USA

Miscellaneous products should be shipped to the unit responsible for the project.

Delivery Format Options

The digital images files shall be delivered to the University in one of the following optional methods. The delivery media must be formatted so that they can be accessed from a variety of computer platforms and operating systems.
Regardless of delivery method used, it is strongly recommended after moving the digital image files on the delivery medium that the MD5 checksums be verified to insure that all data was migrated successfully.

**Portable USB drive**

The University prefers to have the digital files delivered on portable USB drives, whether small flash drives or large external hard drives. For small shipments or corrections, files may be delivered on a small flash drive provided by the vendor. Larger shipments should be delivered on an external USB hard drive. Vendors may use their own external hard drives provided there is no additional cost to the University and are formatted appropriately (see below). Otherwise, vendors may request to use large external hard drives provided by the University, allowing an adequate amount of time for the external hard drive to be prepared and shipped to the vendor.

The file organization structure specified in the Technical Requirements section must be maintained through the process of storing or moving the data to the portable USB drive. Portable USB drives must be formatted using the ExFAT file system to maintain the highest possible degree of interoperability among computer systems and operating systems. All necessary power and data cables and connectors should be included with the delivery. The drive and the file system may not be altered or reformatted without contacting the University ahead of time.

**Secure File Transfer Protocol (sFTP)**

This delivery format is an option available to all vendors who have a secure FTP site from which client files may be downloaded. If a vendor has this option available, the University is willing to discuss this as a possible means of delivery. Should access or delivery become problematic at any time, the University reserves the right to request alternative means of delivery.

**Cloud Storage (e.g., DropBox)**

This delivery format is an option available to all vendors who have a *secure* cloud storage service and can share access with the University for downloading files. This method is a viable means for submitting samples for review. The University is willing to discuss this as a means of delivery for full shipments. Should access or delivery become problematic at any time, the University reserves the right to request alternative means of delivery.

**VII. ERRORS IN DIGITIZED PRODUCT & REWORK**

The staff of the Digital Conversion Unit and DLPS will provide rigorous review, both automated and manual, to insure that the digital data product meets the specifications and requirements of that project. For the purposes of this document, an “error” shall be defined as a digital product of a project which does not meet the requirements of this document, ranging from a single image up to and including an entire shipment.

**Errors by Vendor**

All errors made by the vendor which are identified by the University’s quality control process must be corrected by the vendor at no additional cost to the library.
The University shall notify a vendor of all errors requiring rescanning or data correction immediately upon completion of quality control for that project. The University may identify categories of problems that are pervasive to the entire shipment, but will not specify every single instance for correction. The vendor is expected to review the entire shipment for those categories of problems and correct all instances. The vendor must provide a timeframe for making the corrections and delivery of a new digital product.

Where the vendor cannot meet quality standards or specification due to the condition of the University’s original materials, the vendor should immediately contact DCU/MPublishing for consultation and advice. This consultation must produce a clear direction for the vendor on how to proceed.

If the vendor cannot resolve errors to the University’s satisfaction after multiple requests for correction, the University may terminate the project and ask for all University materials to be returned.

**Errors by University**

There are a number of errors for which the University shall take responsibility and shall hold the vendor blameless:

- Misdesignation of project type, e.g. projects designated as MDP which should have been designated as BibID or vice versa are the responsibility of the University to correct;
- Failure to provide required targets for project type, e.g. projects designated as BibID projects which fail to include a bibliographic target and production note for each volume or bibliographic entity are the responsibility of the University to correct. Vendors encountering this problem must contact the University for advice before shipping the digital product back to the University;
- Failure to provide required identifier for an individual volume, e.g. project materials which do not have sufficient information by which to assign a proper identifier to the directory containing the page images. Vendors encountering this problem must contact the University for advice before shipping the digital product back to the University;
- Errors identified after digital product is accepted and physical materials returned to University.

**VIII. RETURN OF SCANNED MATERIALS**

**Approval Required for Return of Materials**

The Digital Conversion Unit must approve of the return of all scanned materials in writing via email, fax, or postal mail before materials are shipped. Materials may not be returned before the Library has received and approved the scanned data product. Shipments that are returned before approval is obtained from the Digital Conversion Unit may be subject to financial penalties if page images are unacceptable and require rescan. These penalties may accrue up to the entire scanning cost of the shipment if all images are unacceptable and the vendor has returned the materials before the images were approved.
Shipments of materials must be returned complete and shipped complete on the same day; a shipment may not be broken up into separate shipments upon return of materials. Vendors are strongly encouraged to preserve and reuse undamaged packing boxes and padding materials used to ship the library materials to vendor’s facilities.

The vendor is expected to handle each volume with care, and to pack the returning volumes carefully to prevent further damage. Shrink-wrapping each volume or tying each volume with cotton bindery string may prevent the volumes from moving around in the shipping boxes. Rubber bands are not allowed.

**Shipping Requirements & Shipping Address**

All MDP products should be shipped to the following address:

Digital Conversion Unit  
University of Michigan  
837 Greene Street Rm 3212 Buhr  
Ann Arbor, MI 48104-3213  
USA

All BibID products should be shipped to the following address:

MPublishing  
University of Michigan  
837 Greene Street Rm 1100 Buhr  
Ann Arbor, MI 48104-3213  
USA

Miscellaneous products should be shipped to the unit responsible for the project.

UPS Freight Collect Shipping will be required for return shipments of original University materials. By using UPS, the University’s preferred shipper, we benefit from deep price discounting including free inside delivery, as well as shipment and financial tracking in the University’s “CampusShip” system. UPS Shipper No. and Reference information will be provided with the packing list for each shipment of Library materials sent to the vendor.

If the vendor cannot ship materials to be returned via UPS, the vendor must use a shipper that will load and unload from a ground-level loading area at the Buhr Building. Loading areas at the Buhr Building will not accommodate semi-tractor trailer carriers or palletized loads.

**Timing of the Return of Library Materials**

All library materials should be returned to the Library promptly upon the approval of the scanning data, but no later than five (5) business days after approval for the scanned data is sent to the vendor. If the vendor prefers to only ship on certain days, the vendor should propose an alternative shipping plan for the University to review and approve.
The project manager(s) should be notified of the date of the return shipment and by which carrier it was shipped; provision of tracking number is also appreciated.

IX. REVISION OF SPECIFICATIONS

Revision of University Digitization Specifications

These digitization specifications are designed as a general reference document which binds all projects which are engaged with a vendor selected as preferred. However, the Library reserves the right to revise any area of these specifications at any time. The Library will report all formal changes immediately to all preferred vendors as edits or clarifications are made; and the vendor will have three months to conform to those changes or withdraw from its preferred vendor relationship with the Library from the time of notification.

Input, questions, and comments from the vendors are invited on this specification document on an ongoing basis. In particular, any requirements or specifications that would be impossible for a selected vendor to meet should be addressed as soon as possible. Clarification or revision can be requested by participating vendors on any section; the University will attempt to address any and all concerns in a timely manner.

Revision of University Technical Specifications

The technical imaging requirements of these digitization project specifications are undergoing constant refinement. Any number of cooperative projects at the Library may require a revision or alteration of these technical specifications as those projects progress. As the digitization needs of the University evolve or as individual projects demand, the University will modify these technical specifications where appropriate and possible for the purposes of this project. Any periodic modifications to the technical requirements after preferred vendors have been selected will be disseminated to all preferred vendors.

X. SELECTION OF PREFERRED VENDORS

Notification of Selection

All vendors submitting proposals in response to this RFP will be notified as to the final determination of their proposal within 30 days of that determination.

Any vendor whose proposal is not accepted has the right to resubmit a revised proposal within 30 days of receipt of notification for reconsideration. If the revised proposal is still determined to be unacceptable, then that vendor will be excluded from preferred vendor consideration until the next fiscal year.

Vendors new to the University may be invited to submit a proposal for digitization services at any time; however, if their proposal is accepted, their preferred status will not go into effect until the next fiscal year.
**Letter of Agreement**

If a vendor has been selected as a preferred digitization vendor for the University, they will be expected to sign a letter of agreement. The letter stipulates these specifications as the governing requirements of all work as well as the accuracy of the cost detail quoted to the University in the vendor’s proposal.

**Award of Projects to Preferred Vendors**

Selection as a Preferred Vendor for the University does not guarantee that any percentage or number of projects will be awarded to any vendor selected as preferred.

Projects will be awarded based on the University’s determination of what vendor best meets the technical requirements of individual projects. Price and prior performance are criteria which influence the award of individual projects to a particular vendor.
APPENDIX A: CHECKLISTS FOR DIGITAL PRODUCT COMPLIANCE

MDP Project Delivered on Portable USB Drive

Are all of the problems found with any barcode in this delivery been placed in a spreadsheet or tab-delimited file called “vendor scanning notes”?

Are all project directories and files stored in a top-level directory named for the University-assigned shipment number?

Are there an equal number of barcode subdirectories to volumes listed on the packing list?

Are all volumes subdirectories named for the 14-digit barcode of the physical volume?
- Is that barcode on the University supplied packing list?

Is there one and only one image file for each page of each volume?

Are all image files named with proper 8-digit file names?

Do all image files have a proper file extension (either .tif or .jp2)?

Does the sequence of image files for a volume start with 00000001 and increment sequentially for each thereafter?
- Are there appropriate missing page targets in the sequence for volumes with missing pages?

Are all bitonal images in TIFF format?
- Are all bitonal TIFFs in CCITT Group 4 compression?
- Do all bitonal TIFFs have the appropriate TIFF header tags with accurate information?

Are all continuous tone images (color or grayscale) in JPEG2000 format?
- Do the files meet all of the technical requirements of the specifications for JPEG2000?
- Is there a UUID box in the JPEG2000 header? Is there an XMP packet in that UUID box?

Do all images meet the quality and technical parameters required?

MDP Project Delivered via Secure FTP or Cloud Storage

Are all of the problems found with any barcode in this delivery been placed in a spreadsheet or tab-delimited file called “vendor scanning notes”?

Are all project directories and files stored in a top-level directory named for the University-assigned shipment number?

Are there an equal number of barcode subdirectories to volumes listed on the packing list?
Are all volumes subdirectories named for the 14-digit barcode of the physical volume?  
   - Is that barcode on the University supplied packing list?

Is there one and only one image file for each page of each volume?

Are all image files named with proper 8-digit file names?

Do all image files have a proper file extension (either .tif or .jp2)?

Does the sequence of image files for a volume start with 00000001 and increment sequentially for each thereafter?  
   - Are there appropriate missing page targets in the sequence for volumes with missing pages?

Are all bitonal images in TIFF format?  
   - Are all bitonal TIFFs in CCITT Group 4 compression?  
   - Do all bitonal TIFFs have the appropriate TIFF header tags with accurate information?

Are all continuous tone images (color or grayscale) in JPEG2000 format?  
   - Do the files meet all of the technical requirements of the specifications for JPEG2000?  
   - Is there a UUID box in the JPEG2000 header? Is there an XMP packet in that UUID box?

Do all images meet the quality and technical parameters required?

**BibId Project Delivered on Portable USB Drive**

Are all of the problems found with any barcode in this delivery been placed in a spreadsheet or tab-delimited file called “vendor scanning notes”?

Are all project directories and files stored in a top-level directory named for the University-assigned shipment number?

Are all subdirectories of the shipment directory named using the BibID indicated on the production note target?  
   - Do all BibID directories have minimally one volume (four-digit) subdirectory?  
   - Do all volume (four-digit) subdirectories have minimally one issue (three-digit) subdirectory?

Is there one bitonal image file for each page of each volume?

Are all bitonal image files named with proper 8-digit file names?

Do all bitonal image files have a proper .tif file extension?
Does the sequence of image files for a volume start with 00000001 and increment sequentially for each thereafter?
- Are there appropriate missing page targets in the sequence for volumes with missing pages?

Are all bitonal images in TIFF format?
- Are all bitonal TIFFs in CCITT Group 4 compression?
- Do all bitonal TIFFs have the appropriate TIFF header tags with accurate information?

For volumes with contone images, is there a subdirectory of the issue (three-digit) subdirectory named “pages”?
- Are all contone images in the “pages” subdirectory?
- Are all contone image files named according to standard (with a leading “p” character and the same number as the corresponding bitonal page image)?

Are all continuous tone images (color or grayscale) in JPEG2000 format?
- Do the files meet all of the technical requirements of the specifications for JPEG2000?
- Is there a UUID box in the JPEG2000 header? Is there an XMP packet in that UUID box?

Do all images meet the quality and technical parameters required?

**BibID Project Delivered via Secure FTP or Cloud Storage**

Are all of the problems found with any barcode in this delivery been placed in a spreadsheet or tab-delimited file called “vendor scanning notes”?

Are all project directories and files stored in a top-level directory named for the University-assigned shipment number?

Are all subdirectories of the shipment directory named using the BibID indicated on the production note target?
- Do all BibID directories have minimally one volume (four-digit) subdirectory?
- Do all volume (four-digit) subdirectories have minimally one issue (three-digit) subdirectory?

Is there one bitonal image file for each page of each volume?

Are all bitonal image files named with proper 8-digit file names?

Do all bitonal image files have a proper .tif file extension?

Does the sequence of image files for a volume start with 00000001 and increment sequentially for each thereafter?
- Are there appropriate missing page targets in the sequence for volumes with missing pages?

Are all bitonal images in TIFF format?
- Are all bitonal TIFFs in CCITT Group 4 compression?
- Do all bitonal TIFFs have the appropriate TIFF header tags with accurate information?

For volumes with contone images, is there a subdirectory of the issue (three-digit) subdirectory named “pages”?
- Are all contone images in the “pages” subdirectory?
- Are all contone image files named according to standard (with a leading “p” character and the same number as the corresponding bitonal page image)?

Are all continuous tone images (color or grayscale) in JPEG2000 format?
- Do the files meet all of the technical requirements of the specifications for JPEG2000?
- Is there a UUID box in the JPEG2000 header? Is there an XMP packet in that UUID box?

Do all images meet the quality and technical parameters required?
APPENDIX B: INSURANCE AND COMPENSATION

The vendor is responsible for loss and damage from the time Library materials arrive at the vendor’s premises (or from the time the material leaves the Library, if the vendor provides outward transportation) until they are returned to the Library. The University expects the vendor to handle all Library materials with care and to prevent damage and loss to the best of their ability. Minor damage, such as might occur in the wear and tear of reading the materials from cover to cover, is expected during the digitization process.

In the event of pages tearing, multiple pages coming loose, the spine splitting, or covers separating from the book block or similar damage, the vendor shall contact the University about nature and extent of the damage, which will be reviewed by the University upon return of the materials to the Library.

1. If, upon return of the material, the University deems the damage to be substantial, excessive, or unwarranted, the vendor shall compensate the Library as follows:
   a. Mutilated/damaged pages: $50.00 ea.
   b. Bibliographic volumes: Cost of book (or default price of $100.00) plus $50.00 processing fee
      
      Note: these figures cover the Library’s average replacement and processing costs, which include: repair by the Library of the original when possible; or the selection, purchase, cataloging, binding, and preparation for circulation by the Library of a full replacement.

2. The Library reserves the right to deduct from the invoice any charges for vendor’s work performed on a missing or damaged volume.

3. Compensation shall be made either as a direct payment, or as a credit on the next invoice for the same project, within 10 (ten) business days following written notification by the Library.

Miscellaneous projects provided by a unit or department outside the University Library system are likely to have different terms when compensating for damaged or lost materials. The vendor is encouraged to work with each unit to set insurance and compensation terms at the beginning of each project.
APPENDIX C: FILE STRUCTURE ORGANIZATION FOR MICHIGAN DIGITIZATION PROJECT SHIPMENTS

The following section provides a sketch of the file system structure required of the digital product for shipments designated as Michigan Digitization Project (MDP) shipments. This basic file system structure is required regardless of the delivery format chosen (i.e. optical disk or USB hard disk drive).

**File Structure Organization for All File Deliveries**

For all file deliveries, whether using a portable hard drive, sFTP or cloud storage, this file structure requires that top level directories to be named according to the University shipment number assigned to that shipment of volumes. The first level directory must appear on the highest level of the file system.

The next level of directories are created for each volume in the shipment and named according to the 14-digit barcode that appears on the inside of the back cover of the volume. On occasion, a volume may be encountered which has a barcode which appears in another location (e.g. on the back cover) or which has two barcodes. In most cases, the invalid barcode will be “crossed out” or otherwise marred to prevent its use. In all cases, the barcode on the inside back cover should be used as the default barcode to name the volume directory. If the vendor encounters a situation which it cannot clearly discern what barcode is appropriate, then the Digital Conversion Unit should be contacted immediately for direction.

Within those barcode subdirectories, the page image files for the pages associated with that volume should be stored and named according to the pattern specified elsewhere in this document.

It is expected that multiple shipments will be included on the media as space permits; as a result, multiple shipment number directories may appear on this top level. Shipments must be complete; if remaining space does not allow a complete shipment to fit on the drive provided, then the Digital Conversion Unit should be contacted immediately for direction.

*Note:* the University previously allowed delivery of MDP projects via optical disc (CD, DVD). This method of delivery is no longer allowed.

**Example File Structure**

The following table sketches out a sample picture of how this file structure should appear for data delivery on portable USB drive, secure FTP or cloud storage:
Top level

- `<Shipment Number>` (Directory) Shipment number for all volumes contained within
- `<Barcode>` (Directory) Barcode of 1st volume of shipment scanned
  - 00000001.tif TIFF page image file; filename is 8 characters long
  - 00000002.tif TIFF page image file; filename is 8 characters long
  - 00000003.tif
  - 00000004.tif
  - 00000005.jp2 JPEG2000 color or grayscale page image; filename is 8 characters long
  - 00000006.tif
  - 00000007.tif
  - 00000008.tif
  - checksum.md5 MD5 checksum signature file for this subdirectory; *use this filename*

- `<Barcode>` (Directory) Barcode of 2nd volume of shipment scanned
  - 00000001.tif TIFF page image file; filename is 8 characters long
  - 00000002.tif
  - 00000003.tif
  - 00000004.tif
  - ...
  - 00000032.tif
  - 00000033.tif
  - 00000034.jp2 JPEG2000 color or grayscale page image; filename is 8 characters long
  - 00000035.jp2 JPEG2000 color or grayscale page image; filename is 8 characters long
  - 00000036.tif
  - 00000037.tif
  - checksum.md5 MD5 checksum signature file for this subdirectory; *use this filename*

Any questions, clarifications, concerns, or problems experienced by the vendors in producing this file structure should be communicated to the Digital Conversion Production Manager as soon as possible.
APPENDIX D: FILE STRUCTURE ORGANIZATION FOR BIBLIOGRAPHIC IDENTIFIER (BibID) SHIPMENTS

The following section provides a sketch of the file system structure required of the digital product for shipments designated as Bibliographic Identifier (BibID) shipments. This basic file system structure is required regardless of the delivery format chosen (i.e. optical disk or USB hard disk drive).

File Structure Organization for All File Deliveries

For all media deliveries, whether by portable hard drive, secure FTP or cloud storage, this file structure requires that top level directories to be named according to the University shipment number assigned to that shipment of volumes. The first level directory must appear on the highest level of the file system hierarchy.

The file structure requires that subdirectories are created for each bibliographic entity in the shipment and named in a directory hierarchy according to the designation which appears on the production notes target prepared for that physical volume or for the section of the physical volume by MPublishing.

Within this directory hierarchy, the page image files for the pages associated with that volume should be stored and named according to the pattern specified elsewhere in this document.

It is expected that multiple shipments will be included on the media as space permits; as a result, multiple shipment number directories may appear on this top level. Shipments must be complete; if remaining space does not allow a complete shipment to fit on the drive provided, then MPublishing should be contacted immediately for direction.

Note: the University previously allowed delivery of BibID projects via optical disc (CD, DVD). This method of delivery is no longer allowed.

Example File Structure

The following table sketches out a sample picture of how this file structure should appear for data delivery on portable USB drive, secure FTP or cloud storage:

<table>
<thead>
<tr>
<th>Hard drive</th>
<th>bitonals</th>
<th>Top level directory for all bitonal image files</th>

APPENDIX E: SAMPLE VENDOR SCANNING NOTES FILE

Vendors are expected to record any peculiarities or difficulties in the scanning of materials for all projects in a vendor scanning notes file. This file may be either an Excel spreadsheet (.xls, .xlsx) or a tab-delimited text file (.txt).

The contents of this file should have three columns of data. The first column will be the shipment number for the item with problems, the second column will list the barcode of the item, and the third column is a text field listing the problem(s) found. Typical problems are listed below. If there is more than one problem for any item, list all of the problems for that item in the same field, separating each problem with a semicolon (;).

This file should be provided to the project manager upon each data delivery. If multiple shipments of deliverables are sent on one batch to the Library, all problems found for the shipments included in that batch should be listed in a single vendor scanning notes file.

The file name must be “vendor scanning notes” without the quotation marks, with the appropriate three-letter extension for the file format being used (.xls, .xlsx, .txt).

**Sample Vendor Scanning Notes file:**

<table>
<thead>
<tr>
<th>Shipment #</th>
<th>Barcode or ID</th>
<th>Problem Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>2011001</td>
<td>39015021456789</td>
<td>Missing from shipment</td>
</tr>
<tr>
<td>2011001</td>
<td>39015033583267</td>
<td>Extra item not on packing list</td>
</tr>
<tr>
<td>2011001</td>
<td>39015124689875</td>
<td>Missing pages <em>(list page numbers here)</em></td>
</tr>
<tr>
<td>2011001</td>
<td>39015136987654</td>
<td>irregular pagination <em>(list sequence, ex: &quot;pages 238-239 appear between pages 232-233&quot;)</em></td>
</tr>
<tr>
<td>2011002</td>
<td>39015532366909</td>
<td>pages torn <em>(list page numbers here)</em></td>
</tr>
<tr>
<td>2011002</td>
<td>39015855121744</td>
<td>too fragile to scan</td>
</tr>
<tr>
<td>2011002</td>
<td>39015899521651</td>
<td>foldouts too large to capture. Plates I, III, XI, XII, XIV, XXVI; files 15, 19, 89, 93, 97, 149</td>
</tr>
<tr>
<td>2011004</td>
<td>39015160200374</td>
<td>Missing pages (15, 16); foldout too large to capture</td>
</tr>
<tr>
<td>2011004</td>
<td>39015544763258</td>
<td>foldouts too large to capture: all 4 maps in back pocket; files 426-429</td>
</tr>
</tbody>
</table>
APPENDIX F: FOLDOUTS, CENTERFOLDS, OR DOUBLE PAGE SPREADS

The following appendix diagram demonstrates how to scan centerfold diagram, two-page spread in order to capture the full image and maintain the proper recto/verso order of the volume.

Blank back of left side of centerfold

Centerfold (2 pages) in one image (if less than 11” x 17”)

Blank back of right side of centerfold

Blank page inserted to maintain recto and verso
APPENDIX G: DECOMPOSITION LEVELS FOR JPEG2000 FILES

When vendors compress grayscale and color image files with JPEG2000, the number of resolution decomposition levels must be based on the image maximum dimension. The formula for determining decomposition level is:

\[ n = \text{round}\left(\log\left(\frac{\text{height} \times \text{width} \text{ (in pixels)}}{150}\right)/\log(2), 0\right) \]

with hard upper and lower limits: \(5 \leq n \leq 32\).

The following chart provides a quick reference for determining the each decomposition level for most image files, based on largest dimension (length or width).

<table>
<thead>
<tr>
<th>Minimum dimensions (pixels)</th>
<th>Maximum dimensions (pixels)</th>
<th>Minimum dimensions (inches)</th>
<th>Maximum dimensions (inches)</th>
<th>resolution</th>
<th>decomposition level</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>6788</td>
<td>1&quot;</td>
<td>16.97&quot;</td>
<td>400</td>
<td>5</td>
</tr>
<tr>
<td>6789</td>
<td>13576</td>
<td>17&quot;</td>
<td>33.94&quot;</td>
<td>400</td>
<td>6</td>
</tr>
<tr>
<td>13577</td>
<td>26976</td>
<td>34&quot;</td>
<td>67.88&quot;</td>
<td>400</td>
<td>7</td>
</tr>
<tr>
<td>26977</td>
<td>54305</td>
<td>67.9&quot;</td>
<td>135.76&quot;</td>
<td>400</td>
<td>8</td>
</tr>
<tr>
<td>54306</td>
<td>...</td>
<td>135.77&quot;</td>
<td>...</td>
<td>400</td>
<td>9</td>
</tr>
</tbody>
</table>

Technically, smaller items would have decomposition levels ranging from 1-4; however our hard lower limit requires all items with a length or width less than 17 inches/6788 pixels to be set to 5.

It is highly unlikely that many MDP or BibID volumes will have content on pages larger than 135.76"/54305 pixels. However, The University has large format originals (maps, architectural drawings, etc.) in our collection and may arrange special shipments for the vendor to digitize them. Please use the formula above for determining the appropriate decomposition level.
APPENDIX H: XMP METADATA FOR JPEG2000 FILES

Any participating vendor in this pilot project is invited to submit the digital images produced in the JPEG2000 file format. In order to help facilitate the creation of acceptable JPEG2000 image files with appropriate metadata, the following discussion is offered.

XMP documents must be, by requirement of the XMP specification, written to the UUID box of the JPEG2000 file header; it is unacceptable to write this XMP packet to the XML box of the JPEG2000 file header.

Using Exiftool

We recommend using exiftool to insert XMP metadata after creating the JPEG2000 image. This method ensures that the JPEG2000 XMP metadata will match the original TIFF metadata.

For the sake of an example, we've converted 39015064495487/00000021.tif into 39015064495487/00000021.jp2, and the latter does not yet have any XMP metadata. From a Linux command line, one can run:

```
exiftool -tagsFromFile "${original_tiff}"  
    "-XMP-dc:source=${new_docname}"  
    "-XMP-tiff:Compression=JPEG2000"  
    "-IFD0:ImageWidth>XMP-tiff:ImageWidth"  
    "-IFD0:ImageHeight>XMP-tiff:ImageHeight"  
    "-IFD0:BitsPerSample>XMP-tiff:BitsPerSample"  
    "-IFD0:PhotometricInterpretation>XMP-tiff:PhotometricInterpretation"  
    "-IFD0:Orientation>XMP-tiff:Orientation"  
    "-IFD0:SamplesPerPixel>XMP-tiff:SamplesPerPixel"  
    "-IFD0:XResolution>XMP-tiff:XResolution"  
    "-IFD0:YResolution>XMP-tiff:YResolution"  
    "-IFD0:ResolutionUnit>XMP-tiff:ResolutionUnit"  
    "-IFD0:Artist>XMP-tiff:Artist"  
    "-IFD0:Make>XMP-tiff:Make"  
    "-IFD0:Model>XMP-tiff:Model"  
    "-IFD0:Software>XMP-tiff:Software"  
    "-IFD0:ModifyDate>XMP-tiff:DateTime"  
    -overwrite_original "${new_jp2}"
```

There are three variables here:

- `{original_tiff}` should be a path to 39015064495487/00000021.tif
- `{new_jp2}` should be a path to 39015064495487/00000021.jp2
- `{new_docname}` should be exactly 39015064495487/00000021.jp2

If a vendor follows these steps, the vendor will only need to worry about TIFF metadata; exiftool will ensure a smooth transition.

This work is licensed under a Creative Commons Attribution 3.0 Unported License.
Directly Inserting XMP Metadata

If exiftool is unavailable, this section can act as a specification for writing an XMP packet by hand.

The following XML document represents an example of a full XMP packet written to the UUID box of a JPEG2000 image file. The document closely represents what must appear in the JPEG2000 file headers for files produced in this project, with the only changes being in some of the XML element values from file to file:

```xml
<?xpacket begin="" id="w5M0MpCehiHzreSzNTczkc9d"?>
<x:xmpmeta xmlns:x="adobe:ns:meta/">
  <rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/rdf-syntax-ns#">
    <rdf:Description rdf:about="" xmlns:tiff="http://ns.adobe.com/tiff/1.0/">
      <tiff:ImageWidth>2359</tiff:ImageWidth>
      <tiff:ImageLength>3229</tiff:ImageLength>
      <tiff:BitsPerSample>
        <rdf:Seq>
          <rdf:li>8</rdf:li>
        </rdf:Seq>
      </tiff:BitsPerSample>
      <tiff:Compression>34712</tiff:Compression>
      <tiff:PhotometricInterpretation>1</tiff:PhotometricInterpretation>
      <tiff:Orientation>1</tiff:Orientation>
      <tiff:SamplesPerPixel>1</tiff:SamplesPerPixel>
      <tiff:XResolution>400/1</tiff:XResolution>
      <tiff:YResolution>400/1</tiff:YResolution>
      <tiff:ResolutionUnit>2</tiff:ResolutionUnit>
      <tiff:DateTime>2007-01-03T00:00:00+8:00</tiff:DateTime>
      <tiff:Artist>University of Michigan</tiff:Artist>
      <tiff:Make>Zeutschel</tiff:Make>
      <tiff:Model>7000</tiff:Model>
      <tiff:Software>Book Restorer (TM) 3.0.0.44</tiff:Software>
    </rdf:Description>
  </rdf:RDF>
</x:xmpmeta>
<?xpacket end="w"?>
```

The following represents the same XMP document with annotations from the University of Michigan to explain the importance or relevance of individual elements or values. The XMP document itself is represented by text in the “Lucida Sans Console” typeface and the annotations by the University are represented by text in the “Times New Roman” typeface:

```xml
<?xpacket begin="" id="w5M0MpCehiHzreSzNTczkc9d"?>
  • This is the XMP packet leader which XMP scanning application search for to identify the presence of XMP metadata in a digital file; it is required by the XMP specification and must be present for the metadata to be validly encoded in the image file.
</x:xmpmeta>
<?xpacket end="w"?>
```
These elements define the structure of the XMP packet and the namespaces it is working in; it must be present to validate the XML elements which follow.

- **<tiff:ImageWidth>2359</tiff:ImageWidth>**
  - This element represents the number of pixels in the width of the image bitmap; the value here should be identical with the value of TIFF tag number 256; the value must be numeric; it is expected to vary somewhat from image to image.

- **<tiff:ImageLength>3229</tiff:ImageLength>**
  - This element represents the number of pixels in the height of the image bitmap; the value here should be identical with the value of TIFF tag number 257; the value must be numeric; it is expected to vary somewhat from image to image.

- **<tiff:BitsPerSample>8</tiff:BitsPerSample>**
  - This element represents the number of bits per pixel (sample) in the image bitmap; the value here should be identical with the value of TIFF tag number 258; the value must be numeric and must be “8” for all 8-bit grayscale images. For all 24-bit color images, <tiff:BitsPerSample>8</tiff:BitsPerSample> should be repeated three times to represent the three color channels.

- **<tiff:Compression>34712</tiff:Compression>**
  - This element represents the code number for the image format; the value must be numeric and must be “34712” for all JPEG2000 images.

- **<tiff:PhotometricInterpretation>1</tiff:PhotometricInterpretation>**
  - This element represents the color space of the image bitmap; the value here should be identical with the value of TIFF tag number 262; the value must be numeric and must be “1” for all grayscale images, or “2” for all color images.

- **<tiff:Orientation>1</tiff:Orientation>**
  - This element represents the orientation of the image bitmap in its default presentation; the value must be numeric and must be “1” for all images; the value “1” means that the 0th row represents the visual top of the image, and the 0th column represents the visual left-hand side.

- **<tiff:SamplesPerPixel>1</tiff:SamplesPerPixel>**
  - This element represents the number of color samples for each pixel of the image bitmap; the value here should be identical with the value of TIFF tag number 277; the value must be numeric and must be “1” for all grayscale images and “3” for all color images.
<tiff:XResolution>600/1</tiff:XResolution>
   • This element represents the number of pixels per the number of resolution units in the resolution of the image width; the value here should be identical with the value of TIFF tag number 282; the value must be numeric with a dividing slash followed by another numeric; the requirements for this project state that this value must be “600/1” or “400/1” whenever possible; the X resolution and the Y resolution should always be the same value.

<tiff:YResolution>600/1</tiff:YResolution>
   • This element represents the number of pixels per the number of resolution units in the resolution of the image height; the value here should be identical with the value of TIFF tag number 283; the value must be numeric with a dividing slash followed by another numeric; the requirements for this project state that this value must be “600/1” or “400/1” whenever possible; the X resolution and the Y resolution should always be the same value.

<tiff:ResolutionUnit>2</tiff:ResolutionUnit>
   • This element defines what the resolution unit is; the value must be numeric and must be “2” for all images produced for University shipments; the value here should be identical with the value of TIFF tag number 296; the value “2” means the resolution unit is inches.

<tiff:DateTime>2007-01-03T00:00:00+08:00</tiff:DateTime>
   • This element records the date and time of image capture; the value must be in ISO8601 format.

<tiff:Artist>University of Michigan – Digital Conversion Unit</tiff:Artist>
   • This element records who captured this digital image; the value is textual and should be the name of the vendor or scanning unit.

<tiff:Make>Zeutschel</tiff:Make>
   • This element records what make of scanning equipment captured this digital image; the value here should be identical with the value of TIFF tag number 271; the value is textual and should be the name of the manufacturer of the scanning unit.

<tiff:Model>OS7000</tiff:Model>
   • This element records what model of scanning equipment captured this digital image; the value here should be identical with the value of TIFF tag number 272; the value is textual and should be the name or serial number of the model of the scanning unit.

<tiff:Software>Book Restorer (TM) 3.0.0.44</tiff:Software>
   • This element records what software was used to capture this digital image; the value here should be identical with the value of TIFF tag number 305; the value is textual and should include the manufacturer, software name, and version number of the software.

</rdf:Description>
</rdf:Description rdf:about='xmlns:dc=http://purl.org/dc/elements/1.1/'>
   • These elements define the structure of the following element and the namespaces it is working in; it must be present to validate the XML element which follows.
This work is licensed under a Creative Commons Attribution 3.0 Unported License.

<dc:source>12345.0002/00000021.jp2</dc:source>

- This element records the provenance of the image; the value here should be identical with the value of TIFF tag number 269; within UM shipments, the value must follow either the format of <Barcode>/<Image File Name> or the format of <BibID>.<Subdirectory ###>/<Image File Name>. Note that the extension is .jp2, not .tif.

</rdf:Description>
</rdf:RDF>
</x:xmpmeta>
<?xpacket end='w'?>

- These elements close the structure of the XMP packet; they must be present to close the XMP packet within the header.

Using Kakadu

If a vendor chooses to use Kakadu, vendors should take care to note that the software does not supply the bytes that label the UUID box as XMP data. The University has a script and instructions to facilitate this issue and is willing to distribute it to all vendors.

For reference, the following twenty (20) hexadecimal bytes must be prepended to the beginning of the XMP box file:

75 75 69 64
be 7a cf cb
97 a9 42 e8
9c 71 99 94
91 e3 af ac

More Resources

Vendors seeking greater clarity on the XMP metadata specification should consult the documentation at the following URL:

Vendors seeking greater clarity on the definitions for particular XML elements from the TIFF namespace should consult the TIFF 6.0 documentation at the following URL:

Any questions, clarifications, concerns, or problems experienced by the vendors in producing this XMP packet in the JPEG2000 image files should be communicated to the Digital Conversion Production Manager as soon as possible.
APPENDIX I: METADATA TAGS FOR TIFF FILES

To help ensure the long-term sustainability of master images created, the University of Michigan proposes to use some of the data elements in Draft NISO Z39.87 –2002 Standard, Data Dictionary—Technical Metadata for Digital Still Images to record technical metadata in the TIFF header of each image. In addition to required TIFF tags, some additional tags are utilized to document the provenance of each image.

The elements identified in the table below should be incorporated into headers for the master TIFF images. These elements include:

- Required fields for Baseline TIFF grayscale images; these unshaded elements are required for a valid TIFF image.
- Required or recommended elements from the Z39.87 Data Dictionary where appropriate TIFF tags exist; these elements are shaded in the following table.
- Elements in italics should be considered recommended; all others are mandatory and will be subjected to quality review.

We continue to review these specifications and may make changes based on experience and/or changes to the Draft Z39.87 Data Dictionary.
